

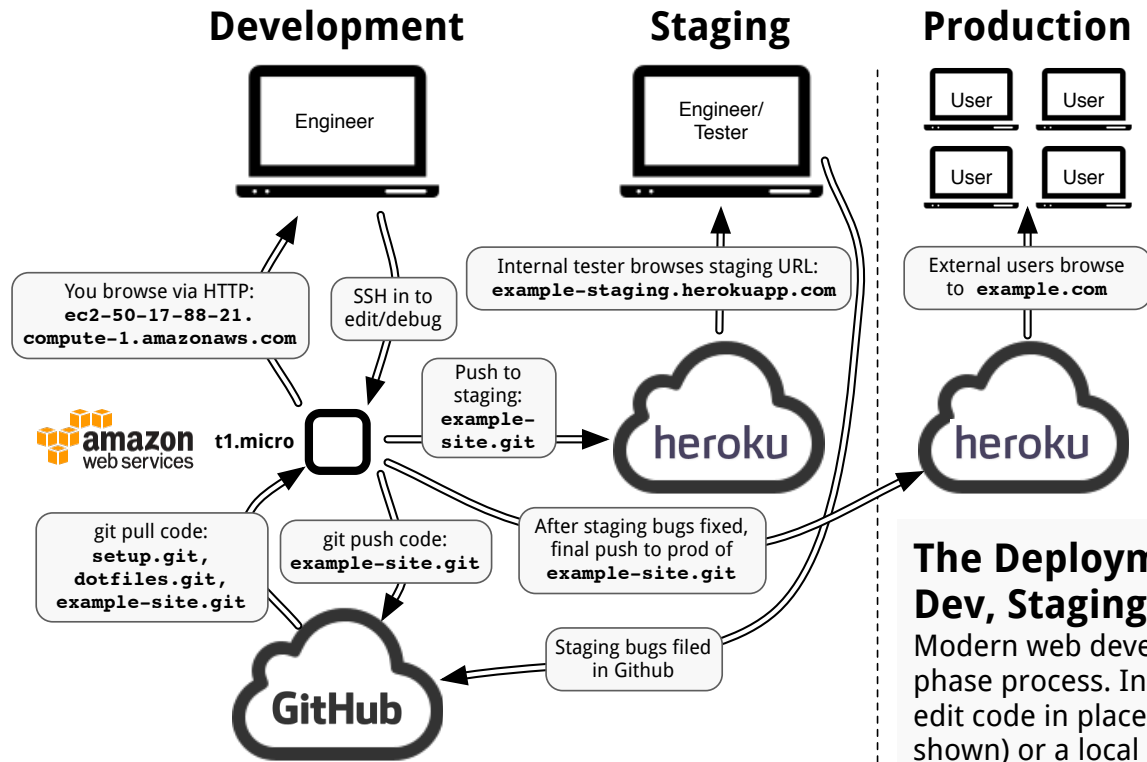

Figure 1: Modern web development proceeds in three phases: dev, staging, and production.

## The Deployment Process Dev, Staging, Production

Modern web development occurs in a three-phase process. In development, engineers edit code in place either on a dev server (as shown) or a local machine, checking that the site renders as expected. Release candidates are then pushed to staging: a complete replica of the production environment to test for final bugs. Once all is well, site code is pushed to production: general availability for all users.
